Optimal Restoration Opportunity

IUCN **natural capital PROJECT**

**Restoration Opportunity
Optimization of
Ecosystem Services for
Landscape Restoration**

**ESPIRITO SANTO STATE
BRAZIL**

**Ecosystem Services:
Sediment Retention
Water Yield**

**Beneficiaries:
Priority Watersheds
Low Income**

This map shows where investments in restoration could be made where the gains in multiple ecosystem services would be optimized throughout 80,000 hectares of potential opportunity area in Espirito Santo State, Brazil. These opportunity areas were identified as a part of the statewide forest landscape restoration assessment using the Restoration Opportunities Assessment Methodology (ROAM)(IUCN and WRI, 2014) and meet Espirito Santo's commitment to the Bonn Challenge.

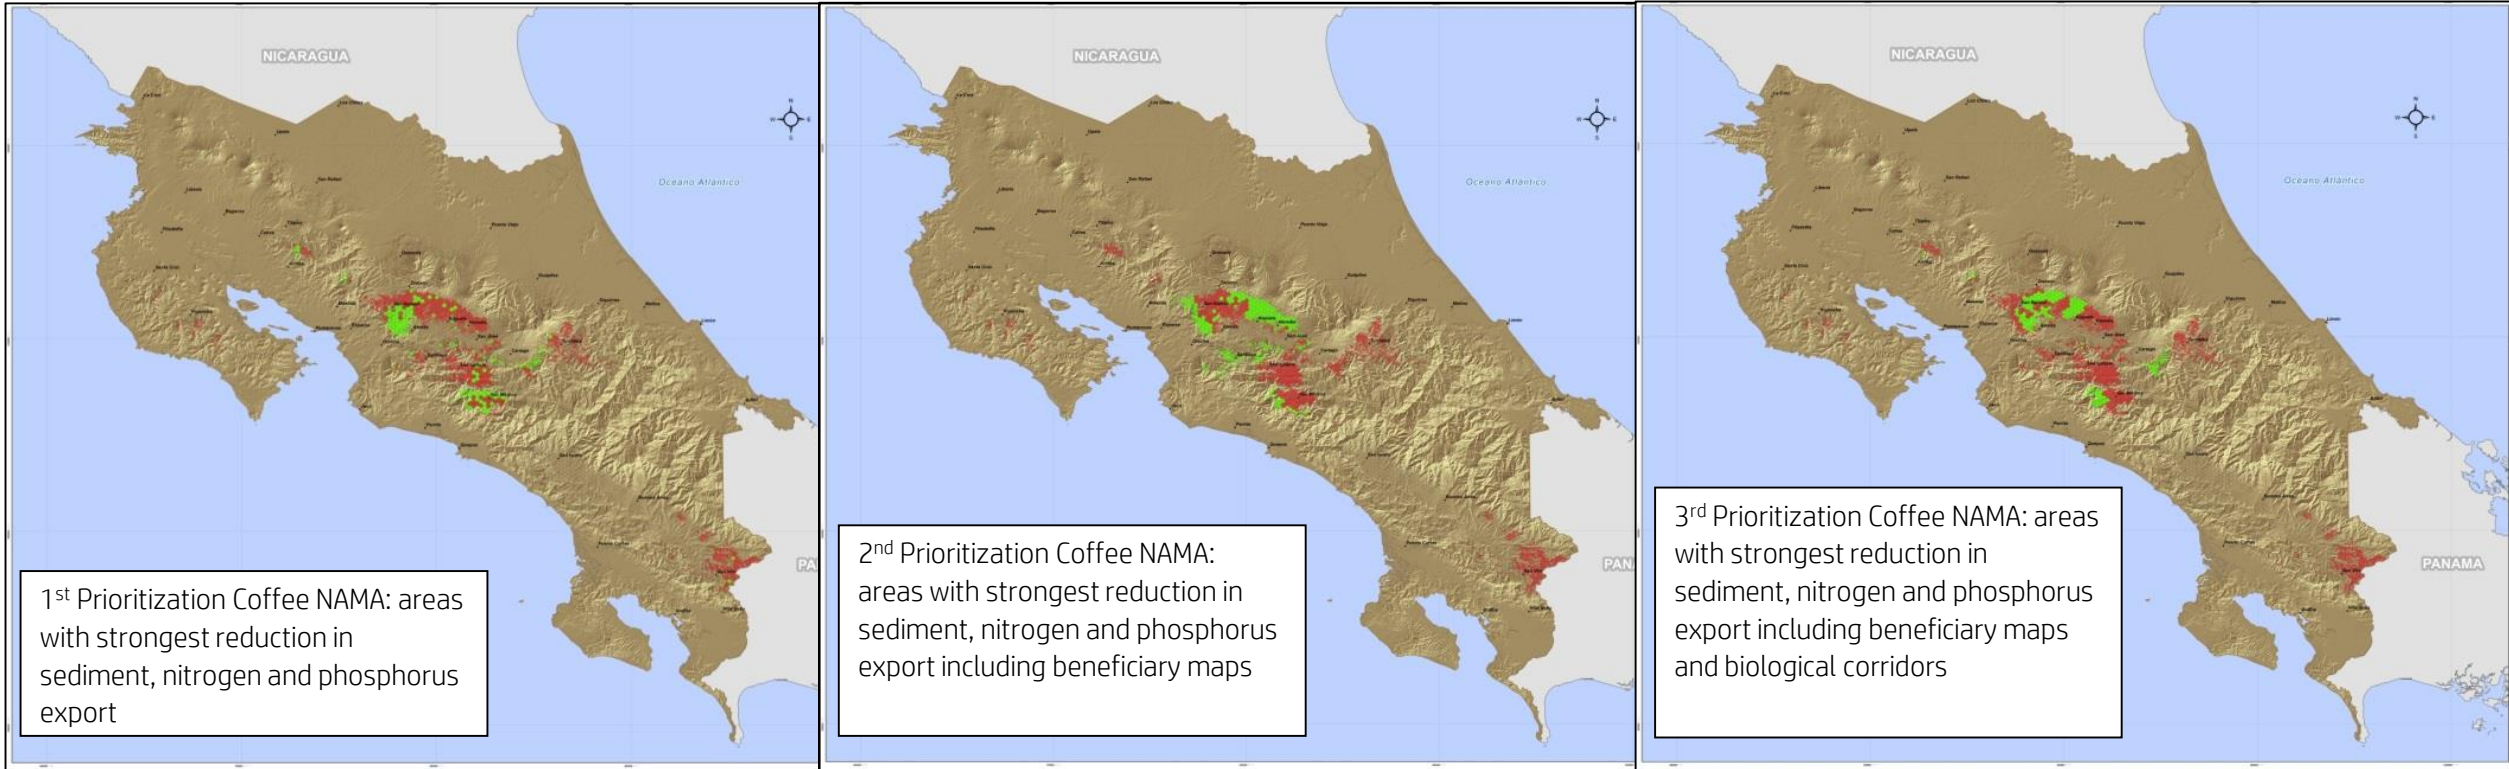

Areas identified in dark blue indicate a high agreement among 50 unique iterations of the optimization model. They indicate that restoration in these areas will have optimal benefits for achieving benefits in both sediment retention and water yield while also considering the optimal locations for restoration where these services may positively impact priority watersheds and in municipalities where incomes are lowest. Hexagons are 1000 hectares large.

Prepared by Craig R. Fleary, International Union for Conservation of Nature (IUCN) August 2017. Data Provided by State of Espirito Santo, World Resource Institute Brazil, and IUCN Brazil. Model prepared using the Restoration Opportunity Optimization Tool (ROOT) co-developed by IUCN and University of Minnesota. Natural Capital Project. Projection: WGS 1984 UTM 24S.

Costa Rica: Nationally Appropriate Mitigation Action Coffee

Current Land Use	Transition	Target ^a (hectares)	Total area ^b (hectares)
Shade coffee	Fertilizer management	25,000	90,000
Sun coffee	Agroforestry system and fertilizer mgmt.		

Program	Current Land Use	Restoration action
Coffee NAMA	Shade coffee	Fertilizer management, and implementation of agroforestry systems where they do not yet exist
	Sun coffee	

The Restoration Opportunities Optimization Tool

The Need:

Provides decision-makers with a tool to wade through and optimize restoration for both social and ecosystem service objectives.

The Application: Goes beyond prioritization among many different services and beneficiaries and helps optimize these decisions, saving time and money and leading to better restoration outcomes.

Results: Generates clearly communicable results in maps that distil many competing and complimentary objectives into optimal suggestions.

Implications: ROOT will lead to smarter and more impactful investments in landscape-scale restoration.
